

To reverse the order of an array we can use two arrays, the original and the new one.

Make them go through a loop and take the values from the original, and store them in backwards into the new array.

Array is passed to function and a new array is created and contents of passed array (in reverse order) are copied into it and finally contents of new array are copied into array passed to function.

OR

We can use the reverse function which reverses the array.

Make an array of a few numbers, then equate the variable used for making an array with the reverse function. The array will automatically be reversed.
